This print-out should have 50 questions. Multiple-choice questions may continue on the next column or page - find all choices before answering.

## LDE Planck relation 001 00110.0 points

What is the energy, in Joules, of a photon of wavelength 200 nm ? What bond energy would this correspond to, in $\mathrm{kJ} \cdot \mathrm{mol}^{-1}$ ?

1. $1.32 \times 10^{-40} \mathrm{~J} ; 7.95 \times 10^{-20} \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
2. $1.32 \times 10^{-21} \mathrm{~J} ; 795 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
3. $9.94 \times 10^{-21} \mathrm{~J} ; 5.99 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
4. $9.94 \times 10^{-19} \mathrm{~J} ; 599 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ correct
5. $9.94 \times 10^{-17} \mathrm{~J} ; 1.65 \times 10^{-43} \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
6. $1.32 \times 10^{-31} \mathrm{~J} ; 7.95 \times 10^{-11} \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$

## Explanation:

$\lambda=200 \mathrm{~nm} \quad c=3 \times 10^{8} \mathrm{~m} / \mathrm{s}$
$h=6.626 \times 10^{-34} \mathrm{~J} \cdot \mathrm{~s}$.
For a photon $c=\lambda \nu$, so

$$
E=h \nu=\frac{h c}{\lambda}
$$

where $c$ is the speed of light and $h$ is Planck's constant.

$$
\begin{aligned}
& E= \frac{h c}{\lambda} \\
&=\left(6.63 \times 10^{-34} \mathrm{~J} \cdot \mathrm{~s}\right)\left(3 \times 10^{8} \mathrm{~m} / \mathrm{s}\right) \\
& \cdot \frac{1}{200 \mathrm{~nm}} \cdot \frac{10^{9} \mathrm{~nm}}{1 \mathrm{~m}} \\
&= 9.94 \times 10^{-19} \mathrm{~J} \\
&\left(9.94 \times 10^{-19} \mathrm{~J}\right)\left(6.022 \times 10^{23} \mathrm{~mol}^{-1}\right) \\
&=599 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}
\end{aligned}
$$

## LDE Balmer Series 001

00210.0 points

Which of the following electronic transitions for a hydrogen atom would correspond to the highest energy emission found in the Balmer series?

1. $\mathrm{n}=2$ to $\mathrm{n}=4$
2. $\mathrm{n}=2$ to $\mathrm{n}=1$
3. $\mathrm{n}=3$ to $\mathrm{n}=1$
4. $\mathrm{n}=1$ to $\mathrm{n}=2$
5. $\mathrm{n}=3$ to $\mathrm{n}=2$
6. $\mathrm{n}=4$ to $\mathrm{n}=2$ correct

## Explanation:

The Balmer series is electronics transitions the involve $\mathrm{n}=2$ and some higher principle energy level (n greater than 2) for the hydrogen atom. An emission occurs when an electron moves from some energy level to a lower energy level. Combining these constraints, $n=4$ to $\mathrm{n}=2$ will be the highest energy emission in the Balmer series, of the available answer choices.

## LDE Classical Failure 002 00310.0 points

Which of the following statement(s) is/are true?
I) The failure of classical mechanics to predict the absorptions/emission spectra of gases is called the ultraviolet catastrophe.
II) Quantum mechanics accurately predicted the behavior of blackbody radiators.
III) The emission spectra of gases are discrete rather than continuous.
IV) Any frequency of light will eject an electron from a metal surface as long as the intensity is sufficient.

1. I and III
2. I, II and IV
3. II, III, and IV
4. II and III correct
5. III and IV

## Explanation:

Classical mechanics predicted that the power radiated by a blackbody radiator would be proportional to the square of the frequency at which it emitted radiation, and thus approach infinity as the frequency increased. This was false, since at higher frequencies blackbody radiators emit less, not more power. This was termed the ultraviolet catastrophe. Classical mechanics also predicted that the energy (velocity) of electrons emitted from a metal surface is proportional to the intensity of light. In reality, the energy (velocity) is only dependent upon the frequency of light. Once the threshold frequency is reached, however, the number of emitted electrons is proportional to the intensity of light. Classical mechanics also fails in explaining the discrete lines in absorption/emission spectrum, which are due to discrete energy levels of electrons in atoms.

## LDE Uncertainty Principle Theory 001 00410.0 points

Which of the following are true consequences of the uncertainty principle?
I) The uncertainty in an electron's momentum can never be less than $\frac{\hbar}{2}$;
II) An electron can be measured in two places at once;
III) Electrons and other particles do not have a well-defined position or momentum like particles in classical mechanics do.

1. I only
2. II and III
3. I and II
4. II only
5. III only correct
6. I and III

## Explanation:

I is false because $\Delta p$ may be less than $\frac{\hbar}{2}$
provided that $\Delta x$ is greater than unity (and vice versa).

II is false because an electron can only be observed in one place at one time, although there may be an equal probability of observing it at two different places.

III is true because quantum mechanics can only give probabilities of a particle having a certain position or momentum and not an exact value.

## De Broglie Wavelength 01 00510.0 points

Consider a flea of mass $4.5 \times 10^{-4} \mathrm{~g}$ moving at $1.0 \mathrm{~m} / \mathrm{s}$ midway through its jump. What is its de Broglie wavelength?

1. $1.4725 \times 10^{-30} \mathrm{~m}$
2. $2.9818 \times 10^{-40} \mathrm{~m}$
3. $2.9818 \times 10^{-37} \mathrm{~m}$
4. $1.47244 \times 10^{-27} \mathrm{~m}$ correct

## Explanation:

$$
\begin{gathered}
m=0.00045 \mathrm{~g} \times \frac{0.001 \mathrm{~kg}}{1 \mathrm{~g}}=4.5 \times 10^{-7} \mathrm{~kg} \\
\lambda=\frac{h}{p}=\frac{h}{m \cdot v} \\
=\frac{6.626 \times 10^{-34} \frac{\mathrm{~kg} \cdot \mathrm{~m}^{2}}{\mathrm{~s}}}{\left(4.5 \times 10^{-7} \mathrm{~kg}\right)(1 \mathrm{~m} / \mathrm{s})} \\
=1.47244 \times 10^{-27} \mathrm{~m}
\end{gathered}
$$

Msci 010303
$006 \quad 10.0$ points

Which of the following is an intensive property?

## 1. weight

2. volume
3. density correct
4. mass
5. number of moles of molecules

## Explanation:

Intensive properties are independent of the amount of matter present. The density of a substance will be the same regardless of the size (large or small) of the sample.

## LDE quantum rules 002 00710.0 points

Which of the following sets of quantum numbers are invalid, i.e. violate one or more boundary conditions?
I) $n=3, \ell=2, m_{\ell}=-2, m_{s}=+\frac{1}{2}$
II) $n=9, \ell=5, m_{\ell}=6, m_{s}=+\frac{1}{2}$
III) $n=2, \ell=1, m_{\ell}=0, m_{s}=+1$
IV) $n=2, \ell=0, m_{\ell}=0, m_{s}=+\frac{1}{2}$
V) $n=1, \ell=0, m_{\ell}=0, m_{s}=-\frac{1}{2}$

1. III only
2. I, III, IV
3. IV only

## 4. I, IV

5. I, II, IV
6. II only
7. I only

## 8. II, III correct

## Explanation:

Set II and III are invalid. For II, $m_{l}=6$ is disallowed because $\ell=5$. For III, $m_{s}=+1$ is disallowed because $m_{s}$ may only be $+\frac{1}{2}$ or $-\frac{1}{2}$.

Msci 051648
$008 \quad 10.0$ points
Hund's rule states that

1. it is impossible to determine accurately both the momentum and position of an electron simultaneously.
2. electrons occupy all the orbitals of a given sublevel singly before pairing begins. correct
3. no two electrons in an atom may have identical sets of four quantum numbers.

## Explanation:

Mlib 024077
$009 \quad 10.0$ points

Write the electron configuration for P .

1. $1 s^{2} 2 s^{2} 2 p^{6} 3 d^{5}$
2. $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{3}$ correct
3. $1 s^{2} 2 s^{2} 2 p^{6} 3 p^{5}$
4. $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6}$

## Explanation:

P has atomic number 15. Follow the pyramid

until exponents sum to 15 .

LDE periodic trend theory 001 $010 \quad 10.0$ points
Which of the following BEST describes the purpose of effective nuclear charge?

1. It is used to rationalize chemical bonding in covalently bonded molecules.
2. It is a method to evaluate how much attraction a given electron "feels" from the nucleus so that periodic trends can be predicted and rationalized. correct
3. It is used to determine the number of valence electrons of a given species.
4. It exists only to torture foolish CH 301 students who did not study.
5. It is a measure of the effect of filled and half-filled subshells on the stability of atoms and ions.
6. It is a measure of how many protons a given atom has which is useful because of variations from isotope to isotope.

## Explanation:

Inner shell electrons "shield" the outer shell electrons from the full attraction of the nucleus. An electron in a higher shell, farther from the nucleus, feels much less attraction, for example; in other words the effective nuclear charge it experiences is smaller. This is used to rationalize the periodic trends.

## LDE Ranking trends 002 <br> $011 \quad 10.0$ points

Rank the following species in terms of increasing electron affinity: Sulfur (S), Rubidium (Rb), Germanium (Ge), Krypton (Kr), Floruine (F)

1. $\mathrm{Kr}<\mathrm{Ge}<\mathrm{Rb}<\mathrm{S}<\mathrm{F}$
2. $\mathrm{Ge}<\mathrm{Rb}<\mathrm{S}<\mathrm{F}<\mathrm{Kr}$
3. $\mathrm{Kr}<\mathrm{Rb}<\mathrm{Ge}<\mathrm{S}<\mathrm{F}$ correct
4. Not enough information
5. $\mathrm{Rb}<\mathrm{Ge}<\mathrm{S}<\mathrm{F}<\mathrm{Kr}$
6. $\mathrm{F}<\mathrm{Ge}<\mathrm{S}<\mathrm{Rb}<\mathrm{Kr}$

## Explanation:

Elements' electron affinities increase across a given period and up and given group. Noble gases (i.e. Kr ) have an electron affinity of essentially zero. Rb is greater than zero, Ge is greater than $\mathrm{Rb}, \mathrm{S}$ is greater than Ge , and $F$ is greater than $P$.

## ChemPrin3e T02 07 <br> $012 \quad 10.0$ points

Which of the following has the highest lattice energy?

## 1. MgO correct

2. BaO
3. KI
4. NaCl
5. CaO

## Explanation:

$\mathrm{Mg}^{2+}$ and $\mathrm{O}^{2-}$ have the highest charge densities.

## Line Drawing to Formula $013 \quad 10.0$ points

Determine the molecular formula for the molecule:

1. $\mathrm{C}_{6} \mathrm{H}_{6}$
2. $\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{Cl}_{2}$

## 3. $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Cl}_{2}$ correct

4. $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{Cl}_{2}$
5. $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{Cl}_{2}$
6. $\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Cl}$

## Explanation:

LDE Lewis Structures 005 01410.0 points

Which of the following is the correct Lewis structure of hydroxylamine $\left(\mathrm{NH}_{2} \mathrm{OH}\right)$ ?

1. $\mathrm{H}-\mathrm{N}=\mathrm{O}_{\mathrm{H}}^{\mathrm{I}_{\mathrm{H}}^{\mathrm{H}}}$
2. $\stackrel{+}{\mid} \underset{\mathrm{N}}{\mathrm{H}}=\stackrel{\mathrm{O}}{\mid}$ :
3. $\stackrel{\mid}{\stackrel{H}{\mid} \mid} \mid$

## Explanation:

## Lewis HCN dash

$015 \quad 10.0$ points
Which of the following is the correct Lewis formula for hydrogen cyanide (HCN)?

1. $\mathrm{H}-\mathrm{C} \equiv \mathrm{N}:$ correct

2. $\quad \because \mathrm{H}=\mathrm{C}=\stackrel{\because}{\mathrm{N}}$.
3. $\mathrm{H}-\ddot{\mathrm{C}}-\ddot{\mathrm{N}}$ :
4. : $\ddot{\mathrm{H}}-\mathrm{C} \equiv \mathrm{N}$ :
5. $\mathrm{H}-\ddot{\mathrm{C}}-\mathrm{N}$
6. : $\ddot{\mathrm{H}}-\ddot{\mathrm{C}}-\ddot{\mathrm{N}}$ :
7. : $\quad \ddot{\mathrm{H}}-\ddot{\mathrm{C}}=\stackrel{.}{\mathrm{N}}$.
8. : $\quad \underset{\mathrm{H}}{\mathrm{H}}-\ddot{\mathrm{C}}-\stackrel{.}{\mathrm{N}}$ :
9. : $\mathrm{H}-\mathrm{C}-\mathrm{N}$ :

## Explanation:

The Lewis formula for hydrogen cyanide $(\mathrm{HCN})$ is $\quad \mathrm{H}-\mathrm{C} \equiv \mathrm{N}:$

Mlib 031025
$016 \quad 10.0$ points
How many resonance structures are there for the $\mathrm{NO}_{3}^{-}$polyatomic ion?

1. 3 correct
2. 2
3. 1
4. This molecule does not exhibit resonance.
5. 5
6. 4

Explanation:

## ChemPrin3e 0276 <br> 01710.0 points

Which of the three Lewis structures is the most important for the fulminate ion $\left(\mathrm{CNO}^{-}\right)$?
I) $\begin{gathered}-2 \quad+1 \\ \ddot{\mathrm{C}}=\mathrm{N}= \\ . . \\ \ddot{\mathrm{O}}\end{gathered}$
II) $\begin{array}{ccc}-3 & +1 & +1 \\ . \ddot{C} & & \end{array}$
$: \ddot{\mathrm{C}}-\mathrm{N} \equiv \mathrm{O}$
III) $\begin{array}{lll}-1 & +1 & -1\end{array}$
$\ddot{\mathrm{C}} \equiv \mathrm{N}-\ddot{\mathrm{O}}:$

1. None of these is important.
2. I only
3. I and II only
4. I and III only
5. III only correct
6. II and III only
7. II only
8. All of these are important.

## Explanation:

is probably the most important as it is the structure with the formal charges of the individual atoms closest to zero.

## Brodbelt 0804 <br> $018 \quad 10.0$ points

$\mathrm{ICl}_{3}$ is $s p^{3} d$ hybridized. What is the electronic
and molecular geometry?

1. octahedral; T-shaped
2. trigonal bipyramidal, seesaw
3. trigonal bipyramidal; T-shaped correct
4. tetrahedral; pyramidal
5. trigonal planar; trigonal planar

## Explanation:

The hybridization tells us that there are 5 regions of high electron density. Three of those regions are the bonded Cl atoms. The other two regions must be lone pairs of electrons on the central I atom. This corresponds to trigonal bipyramidal electronic geometry and T-shaped molecular geometry.

## LDE VSEPR Molecular Geometry 002 <br> $019 \quad 10.0$ points

Which of the following molecules is/are polar?
I)

II)

1. I, II, III
2. I only
3. I, III correct
4. III only

## 5. I, II

6. II, III
7. II only

## Explanation:

Molecule II is symmetrical and therefore its individual dipole moments cancel, making it non-polar. Molecules I and III are asymmetrical and therefore polar.

## LDE VB Sigma Pi Bonds 004 $020 \quad 10.0$ points

How many sigma $(\sigma)$ and pi $(\pi)$ bonds are in the Lewis structure for $\mathrm{C}(\mathrm{COOH})_{4}$ ?

1. $12 \sigma, 0 \pi$
2. $8 \sigma, 4 \pi$
3. $16 \sigma, 0 \pi$
4. $12 \sigma, 4 \pi$
5. $16 \sigma, 4 \pi$ correct

## Explanation:

## Brodbelt 8200504

$021 \quad 10.0$ points
Give the hybridization of each central atom: nitrogen, middle carbon, right carbon.

1. $s p^{3}, s p^{2}, s p^{3}$
2. $s p^{2}, s p^{3}, s p^{3}$
3. $s p^{2}, s p^{2}, s p^{2}$
4. $s p^{3}, s p^{3}, s p^{3}$
5. $s p, s p^{3}, s p^{3}$
6. $s p^{2}, s p, s p^{2}$
7. $s p, s p, s p$
8. $s p^{2}, s p^{2}, s p^{3}$ correct

## Explanation:

Hybridization is chosen based on the electronic geometry around the central atom, which is based on the number of RHED around the central atom. The RHED are three, three, and four.

## LDE VB Hybridization 002 <br> $022 \quad 10.0$ points

Consider the thionoester molecule

What orbitals were used to form the $\pi$ (pi) bond?

1. $s p^{2}, 3 s$
2. $2 s, 3 p$
3. $s p^{3}, 3 s$
4. $s p^{3}, 3 p$
5. $2 p, 3 p$ correct

Explanation:
LDE Bond Order 009
$023 \quad 10.0$ points
$023 \quad 10.0$ points
All of the species below have the same bond order except for one of them. Which is it?

1. $\mathrm{H}_{2}^{+}$
2. $\mathrm{F}_{2}^{-}$
3. $\mathrm{B}_{2}^{-}$correct
4. $\mathrm{H}_{2}^{-}$
5. $\mathrm{Ne}_{2}^{+}$

## Explanation:

All of the species have a bond order of 0.5 except for $\mathrm{B}_{2}^{-}$, which has a bond order of 1.5.

## LDE Paramagnetism 004 <br> $024 \quad 10.0$ points

Which of the following species is/are paramagnetic?
I) $\mathrm{Li}_{2}^{-}$
II) $\mathrm{O}_{2}$
III) $\mathrm{H}_{2}^{+}$

1. I only
2. I and III
3. III only
4. II only
5. II and III
6. I and II
7. I, II and III correct

## Explanation:

$\mathrm{Li}_{2}^{-}$and $\mathrm{H}_{2}^{+}$both have an odd number of electrons and therefore must be paramagnetic. $\mathrm{O}_{2}$ has 16 total electrons, the last two of which must go into separate degenerate $\pi^{*}$ anti-bonding orbitals.

## Msci 120911

$025 \quad 10.0$ points
2.0 g of $\mathrm{H}_{2}$ and 8.0 g of He are put in a 22.4 liter container at $0^{\circ} \mathrm{C}$. The total pressure is

$$
\begin{array}{lr}
n_{\mathrm{H}_{2}}=\frac{2 \mathrm{~g} \cdot \mathrm{~mol}}{2 \mathrm{~g}}=1 \mathrm{~mol} & V=22.4 \mathrm{~L} \\
n_{\mathrm{He}}=\frac{8 \mathrm{~g} \cdot \mathrm{~mol}}{4 \mathrm{~g}}=2 \mathrm{~mol} & n_{\text {total }}=3 \mathrm{~mol} \\
T=0^{\circ} \mathrm{C}+273=273 \mathrm{~K} &
\end{array}
$$

Applying the ideal gas law equation,

$$
\begin{aligned}
P V & =n R T \\
P & =\frac{n R T}{V} \\
P & =\frac{(3 \mathrm{~mol})\left(0.08206 \frac{\mathrm{~L} \cdot \mathrm{~atm}}{\mathrm{~mol} \cdot \mathrm{~K}}\right)(273 \mathrm{~K})}{22.4 \mathrm{~L}} \\
& =3.00032 \mathrm{~atm}
\end{aligned}
$$

Msci 12 0918a
$026 \quad 10.0$ points
What volume will 40.0 L of He at $50.00^{\circ} \mathrm{C}$ and 1201 torr occupy at STP?

## 1. 53.4 L correct

2. 26.7 L
3. 31.1 L
4. 12.8 L
5. 18.6 L

## Explanation:

$P_{1}=1201$ torr $\quad P_{2}=760$ torr
$V_{1}=40 \mathrm{~L} \quad T_{2}=273.15 \mathrm{~K}$
$T_{1}=50^{\circ}+273.15=323.15 \mathrm{~K}$
Using the Combined Gas Law,

$$
\frac{P_{1} V_{1}}{T_{1}}=\frac{P_{2} V_{2}}{T_{2}}
$$

and recalling that STP implies standard temperature (273.15 K) and pressure (1 atm or 760 torr), we have

$$
\begin{aligned}
V_{2} & =\frac{P_{1} V_{1} T_{2}}{T_{1} P_{2}} \\
& =\frac{(1201 \text { torr })(40.0 \mathrm{~L})(273.15 \mathrm{~K})}{(323.15 \mathrm{~K})(760 \text { torr })} \\
& =53.4302 \mathrm{~L}
\end{aligned}
$$

4. 5.0 atm .

Explanation:

Mass Density and Pressure
$027 \quad 10.0$ points

A sample of nitrous oxide gas (NO) has a density of $12 \mathrm{~g} \mathrm{~L}{ }^{-1}$. What pressure does the sample exert at $27^{\circ} \mathrm{C}$ ?

1. 1.0 atm
2. 61.6 atm
3. not enough information
4. 997.9 atm
5. 9.9 atm correct

## Explanation:

By thoughtful substitutions and rearrangement, the ideal gas law can be used to relate the mass density of a gas to its pressure.
$\mathrm{PV}=\mathrm{nRT}$
Recalling that a number of moles ( n ) is equal to a mass ( m ) divided by a molecular weight (M.W.), we can substitute into the ideal gas law.
$\mathrm{n}=\frac{\mathrm{m}}{\mathrm{M} . \mathrm{W}_{\mathrm{m}}}$
$\mathrm{PV}=\frac{\mathrm{m} . \mathrm{W} .}{\mathrm{MT}}$
This can be rearranged to solve for P .
$\mathrm{P}=\frac{\mathrm{m}}{\mathrm{V}} \frac{\mathrm{RT}}{\mathrm{M} \cdot \mathrm{W}}$
By substituting the definition of density $(\rho)$, we can arrive at a readily usable equation.

$$
\rho=\frac{\mathrm{m}}{\mathrm{~V}}
$$

$\mathrm{P}=\rho \frac{\mathrm{RT}}{\mathrm{M} . \mathrm{W}}=12 \frac{0.0821 \times 300}{30}=9.852 \mathrm{~atm}$

> Brodbelt 12 04a
> $028 \quad 10.0$ points

For the reaction

$$
2 \mathrm{HCl}+\mathrm{Na}_{2} \mathrm{CO}_{3} \rightarrow 2 \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}
$$

179.2 liters of $\mathrm{CO}_{2}$ is collected at STP. How many moles of NaCl are also formed?

1. 16.0 moles correct
2. 6.0 moles
3. 12.5 moles
4. 4.0 moles
5. 32.0 moles
6. 8.0 moles

## Explanation:

$V_{\mathrm{CO}_{2}}=179.2 \mathrm{~L}$
At STP we can use the standard molar volume, $22.4 \mathrm{~L} / \mathrm{mol}$.

$$
\frac{179.2 \mathrm{~L}}{22.4 \mathrm{~L} / \mathrm{mol}}=8.00 \mathrm{~mol} \mathrm{CO}_{2}
$$

$8.00 \mathrm{~mol} \mathrm{CO}_{2} \times \frac{2 \mathrm{~mol} \mathrm{NaCl}}{1 \mathrm{~mol} \mathrm{CO}_{2}}=16.0 \mathrm{~mol} \mathrm{NaCl}$

## rms velocity of He 01 02910.0 points

Helium has a rms velocity ( $v_{\text {rms }}$ ) that is 4.21 times faster than which of the following gases?

1. neon, Ne
2. chlorine, $\mathrm{Cl}_{2}$ correct
3. xenon, Xe
4. oxygen, $\mathrm{O}_{2}$
5. argon, Ar

## Explanation:

The relationship of rms velocities between different molecules is:

$$
\frac{\text { rate } \mathrm{A}}{\operatorname{rate} \mathrm{~B}}=\sqrt{\frac{\operatorname{mass} \mathrm{B}}{\operatorname{mass} \mathrm{~A}}}
$$

Let massA be helium's mass of 4.0 and 4.21 be heliums rate so that:

$$
\begin{gathered}
\frac{4.21}{1}=\sqrt{\frac{\mathrm{massB}}{4.0}} \\
(4.21)^{2}=\frac{\mathrm{massB}}{4.0} \\
70.9=\text { massB }
\end{gathered}
$$

This only matches the chlorine gas, $\mathrm{Cl}_{2}$.
LDE Gas Non-ideality 002
$030 \quad 10.0$ points

Which of the following does not affect the ideality of gases?
I) the temperature of the gas
II) the density of the gas
III) the size of the gas molecules

1. III only
2. I only
3. II only
4. I, II, and III
5. II and III
6. none of the above correct
7. I and III
8. I and II

## Explanation:

All of the listed factors influence gas ideality.

LDE Intermolecular Forces 001 03110.0 points

Which of the following statements regarding intermolecular forces (IMF) is/are true?
I) Intermolecular forces result from attractive forces between regions of positive and negative charge density in neighboring molecules.
II) The stronger the bonds within a molecule are, the stronger the intermolecular forces will be.
III) Only non-polar molecules have instantaneous dipoles.

1. II and III

## 2. I only correct

3. III only
4. I and II
5. II only
6. I, II, and III
7. I and III

## Explanation:

Statement I is true - all IMF result from Coulombic attraction. Statements II and III are both false; the strength of the bonds within a molecule have no bearing on the strength of the bonds between molecules; all molecules have London forces.

## LDE Intermolecular Forces 002 03210.0 points

Which of the following is not correctly paired with its dominant type of intermolecular forces?

1. $\mathrm{NH}_{3}$, hydrogen bonding
2. $\mathrm{SiH}_{4}$, instantaneous dipoles
3. $\mathrm{C}_{6} \mathrm{H}_{6}$ (benzene), instantaneous dipoles
4. CaO , ionic forces
5. HBr , hydrogen bonding correct

## Explanation:

London forces, dispersion forces, van der Waals' forces, instantaneous or induced dipoles all describe the same intermolecular force. London forces are induced, short-lived, and very weak. Molecules and atoms can experience London forces because they have electron clouds. London forces result from the distortion of the electron cloud of an atom or molecule by the presence of nearby atoms or molecules.

Permanent dipole-dipole interactions are stronger than London forces and occur between polar covalent molecules due to charge separation.

H-bonds are a special case of very strong dipole-dipole interactions. They only occur when H is bonded to small, highly electronegative atoms - F, O or N only.

Ion-ion interactions are the strongest due to extreme charge separation and occur between ions (including polyatomic ions). They can be
thought of as both inter- and intramolecular bonding.

HBr is a polar molecule that does not contain H bonds; therefore, dipole-dipole forces will be the most significant type of intermolecular forces present.

## Explaining Dispersion Forces $033 \quad 10.0$ points

Carbon tetrachloride $\left(\mathrm{CCl}_{4}\right)$ and $n$-octane $\left(\mathrm{C}_{8} \mathrm{H}_{18}\right)$ are both non-polar molecules. At standard pressure, they boil at 345 K and 399 K , respectively. Which answer choice below correctly explains their boiling points?

1. $\mathrm{C}_{8} \mathrm{H}_{18}$ has a higher boiling point because its electron cloud is larger and allows it to form more instantaneous dipoles. correct
2. $\mathrm{C}_{8} \mathrm{H}_{18}$ has a higher boiling point because its greater molecular weight enables it to form stronger instantaneous dipoles.
3. $\mathrm{C}_{8} \mathrm{H}_{18}$ has a higher boiling point because its smaller surface area allows it to form stronger instantaneous dipoles.
4. $\mathrm{CCl}_{4}$ has a lower boiling point because its smaller surface area allows it to form stronger instantaneous dipoles.
5. $\mathrm{CCl}_{4}$ has a lower boiling point because its greater molecular weight enables it to form stronger instantaneous dipoles.

## Explanation:

Carbon tetrachloride $\left(\mathrm{CCl}_{4}\right)$ and $n$-octane $\left(\mathrm{C}_{8} \mathrm{H}_{18}\right)$ both have only instantaneous dipoles. Despite the fact that $\left(\mathrm{CCl}_{4}\right)$ has a greater molecular weight ( $153.81 \mathrm{~g} \mathrm{~mol}^{-1}$ ) compared to $\mathrm{C}_{8} \mathrm{H}_{18}\left(114.23 \mathrm{~g} \mathrm{~mol}^{-1}\right)$, the lat-
ter boils at a substantially higher temperature. In general, dispersion forces are greater in molecules with greater molecular weight, more total electrons and a larger surface area (i.e. the shape of the molecule). Since $n$ octane is a long skinny molecule, more of its electrons are accessible and ready to form instantaneous dipoles.

## LDE Physical Properties 001 03410.0 points

Which of the following statements about boiling is false?

1. As intermolecular forces increase, boiling point increases as well.
2. The boiling point of a liquid is independent of atmospheric pressure. correct
3. Boiling occurs when vapor pressure exceeds atmospheric pressure.
4. For a given pressure, the boiling point is always at a higher temperature than melting point.

## Explanation:

Boiling point is directly proportional to atmospheric pressure.

## VP IMF Ranking $035 \quad 10.0$ points

Rank the compounds
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} \quad \mathrm{CH}_{3} \mathrm{NH}_{2} \quad \mathrm{CH}_{3} \mathrm{OH} \quad \mathrm{NaOH}$ in terms of increasing vapor pressure.

$$
\text { 1. } \begin{aligned}
\mathrm{NaOH}<\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} & <\mathrm{CH}_{3} \mathrm{OH} \\
& <\mathrm{CH}_{3} \mathrm{NH}_{2} \text { correct }
\end{aligned}
$$

2. $\mathrm{CH}_{3} \mathrm{NH}_{2}<\mathrm{CH}_{3} \mathrm{OH}<\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$ $<\mathrm{NaOH}$
3. $\mathrm{NaOH}<\mathrm{CH}_{3} \mathrm{NH}_{2}<\mathrm{CH}_{3} \mathrm{OH}$

$$
<\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}
$$

4. $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}<\mathrm{CH}_{3} \mathrm{OH}<\mathrm{CH}_{3} \mathrm{NH}_{2}$ $<\mathrm{NaOH}$
5. $\mathrm{NaOH}<\mathrm{CH}_{3} \mathrm{OH}<\mathrm{CH}_{3} \mathrm{NH}_{2}$
$<\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$

## Explanation:

## LaBrake CIC CH5 02 <br> $036 \quad 10.0$ points

Which of the following substances would you predict might evaporate the fastest?

1. $\mathrm{C}_{8} \mathrm{H}_{18}$
2. $\mathrm{C}_{10} \mathrm{H}_{22}$
3. $\mathrm{C}_{12} \mathrm{H}_{24}$

## 4. $\mathrm{C}_{6} \mathrm{H}_{14}$ correct

## Explanation:

All the listed molecules are nonpolar hydrocarbons; therefore the dominant intermolecular force that exists in the condensed phase of all listed molecules is dispersion forces. Therefore, the molecule with the least number of atoms and the lowest molecular weight would have the lowest dispersion forces, and therefore would evaporate the easiest.

## LDE Thermodynamic Theory 012 U not E $037 \quad 10.0$ points

Which of the following statements concerning the laws of thermodynamics is not true?

1. $\mathrm{S}=0$ for a perfect crystal at absolute zero.
2. $\Delta \mathrm{U}_{\text {univ }}=0$
3. Entropy always increases in an isolated system.
4. $\Delta \mathrm{S}_{\text {univ }}>0$
5. Free energy is conserved in a closed system. correct

## Explanation:

Free energy is conserved in an isolated system, but not in a closed system.

For which of the following reactions at room temperature $\left(25^{\circ} \mathrm{C}\right)$ would there be 5.0 kJ of work done on the system?

1. $2 \mathrm{H}_{2} \mathrm{O}(\ell)+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}_{2}(\ell)$
2. $\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightarrow \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g})$
3. $\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

$$
\begin{aligned}
& \text { 4. } \mathrm{N}_{2} \mathrm{H}_{2}(\mathrm{~g})+\mathrm{CH}_{3} \mathrm{OH}(\mathrm{~g}) \rightarrow \\
& \mathrm{CH}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g})
\end{aligned}
$$

5. $\mathrm{CH}_{2} \mathrm{O}(\mathrm{g})+\mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow$

$$
\mathrm{N}_{2} \mathrm{H}_{2}(\mathrm{~g})+\mathrm{CH}_{3} \mathrm{OH}(\mathrm{~g}) \text { correct }
$$

6. $2 \mathrm{H}_{2} \mathrm{O}_{2}(\ell) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\ell)+\mathrm{O}_{2}(\mathrm{~g})$

## Explanation:

At room temperature ( 298 K ), the product of the gas constant $(R=$ $8.314 \mathrm{~J} \cdot \mathrm{~mol}^{-1} \cdot \mathrm{~K}^{-1}$ ) and $T$ is very close to $2.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$. Based on $5.0 \mathrm{~kJ}=$ $-\Delta n_{\text {gas }}\left(2.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)$, the reaction for which $\Delta n_{\text {gas }}=-2$ will be the correct answer.

## LDE Bomb Calorimeter 002 $039 \quad 10.0$ points

If we set up a bomb calorimetry experiment to determine the molar internal energy of combustion of ethene $\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)$ using 1 L of water as our heat sink, 2.805 g of ethene, and measure an initial and final temperature of $25.20^{\circ} \mathrm{C}$ and $58.92^{\circ} \mathrm{C}$, respectively, what will be the experimentally determined molar internal energy of combustion of ethene? Assume the density of water is $1.00 \mathrm{~g} \cdot \mathrm{~mL}^{-1}$ and the calorimeter itself absorbs no heat. The specific heat capacity of water is 4.184 $\mathrm{J} \cdot \mathrm{g}^{-1} \cdot \mathrm{~K}^{-1}$.

1. $-14.11 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
2. $-141.1 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
3. $-14,110 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
4. $-141,100 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
5. $-1,411 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ correct

## Explanation:

$$
\begin{aligned}
& \Delta T=T_{f}-T_{i}=58.92^{\circ} \mathrm{C}-25.20^{\circ} \mathrm{C} \\
& =33.72^{\circ} \mathrm{C}=33.72 \mathrm{~K} \\
& m=(1 \mathrm{~L}) \cdot \frac{1000 \mathrm{~mL}}{\mathrm{~L}} \cdot \frac{1.00 \mathrm{~g}}{\mathrm{~mL}}=1000 \mathrm{~g} \\
& n=2.805 \mathrm{~g} \text { ethene } \cdot \frac{28.05 \mathrm{~g}}{\mathrm{~mol}}=0.1 \mathrm{~mol} \\
& \frac{\Delta U r x n}{n}=\frac{-\Delta U c a l}{n}=\frac{-m c \Delta T}{n} \\
& =-\frac{1000 \mathrm{~g} \cdot \frac{4.184 \mathrm{~J}}{\mathrm{~g} \cdot \mathrm{~K}} \cdot 33.72 \mathrm{~K}}{0.1 \mathrm{~mol}} \\
& =-1,411 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}
\end{aligned}
$$

## LDE Bond Enthalpy 002 <br> $040 \quad 10.0$ points

Using the provided bond enthalpy data, calculate the change in enthalpy for the following reaction:

$$
\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \longleftrightarrow \mathrm{CH}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

1. $-577 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
2. $710 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
3. $577 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
4. $-710 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
5. $349 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
6. $-349 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ correct

## Explanation:

$$
\begin{aligned}
& \Delta H_{r x n} \\
&= \sum \mathrm{BE}_{\text {reactants }}-\sum \mathrm{BE}_{\text {products }} \\
&= {\left[4\left(412 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)+496 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right] } \\
&-\left[2\left(412 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)+743 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right. \\
&\left.\quad+2\left(463 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)\right] \\
&=-349 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}
\end{aligned}
$$

## ChemPrin3e T06 48 $041 \quad 10.0$ points

Calculate the standard enthalpy of combustion of butane $\left(\mathrm{C}_{4} \mathrm{H}_{10}(\mathrm{~g})\right)$ at 298 K from standard enthalpy of formation data.

1. $-2056.49 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
2. $-2877.04 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ correct
3. $-895.49 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
4. $-2843.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
5. $-2342.32 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$

## Explanation:

The balanced equation is

$$
\mathrm{C}_{4} \mathrm{H}_{10}(\mathrm{~g})+\frac{13}{2} \mathrm{O}_{2} \rightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+5 \mathrm{H}_{2} \mathrm{O}(\ell)
$$

$$
\begin{aligned}
\Delta H_{\mathrm{comb}}= & \sum \Delta H_{\mathrm{f} \text { prod }}^{\circ}-\sum \Delta H_{\mathrm{f} \text { react }}^{\circ} \\
= & {\left[5 \Delta H_{\mathrm{f} \mathrm{H}_{2} \mathrm{O}(\ell)}^{\circ}+4 \Delta H_{\mathrm{f} \mathrm{CO}_{2}(\mathrm{~g})}^{\circ}\right] } \\
& -\Delta H_{\mathrm{f} \mathrm{C}_{4} \mathrm{H}_{10}(\mathrm{~g})}^{\circ} \\
= & {[5(-285.83 \mathrm{~kJ} / \mathrm{mol})} \\
& \quad+4(-393.51 \mathrm{~kJ} / \mathrm{mol})] \\
& -(-126.15 \mathrm{~kJ} / \mathrm{mol})
\end{aligned}
$$

## LDE Thermodynamic Signs 001 $042 \quad 10.0$ points

When wood is burning (i.e. a combustion process is occurring), which of the following quantities is positive?

1. Change in enthalpy.
2. Work.
3. Change in Gibbs' free energy.
4. Change in entropy. correct

## Explanation:

A burning piece of wood produces a lot of gas and thus does expansion work on the surroundings so work is negative, not positive. It is an exothermic reaction (producing heat) so enthalpy change is negative, not positive. It happens spontaneously so change in free energy is negative, not positive. Finally, all the gas produced yields an increase in entropy so the change is indeed positive.

## ChemPrin3e 072526 <br> 04310.0 points

Which one shows the substances in the decreasing order of their molar entropy?

1. $\mathrm{C}(\mathrm{s}), \mathrm{H}_{2} \mathrm{O}(\mathrm{g}), \mathrm{H}_{2} \mathrm{O}(\ell), \mathrm{H}_{2} \mathrm{O}(\mathrm{s})$
2. $\mathrm{C}(\mathrm{s}), \mathrm{H}_{2} \mathrm{O}(\ell), \mathrm{H}_{2} \mathrm{O}(\mathrm{g}), \mathrm{H}_{2} \mathrm{O}(\mathrm{s})$
3. None of these
4. $\mathrm{H}_{2} \mathrm{O}(\mathrm{s}), \mathrm{H}_{2} \mathrm{O}(\ell), \mathrm{H}_{2} \mathrm{O}(\mathrm{g}), \mathrm{C}(\mathrm{s})$
5. $\mathrm{C}(\mathrm{s}), \mathrm{H}_{2} \mathrm{O}(\mathrm{s}), \mathrm{H}_{2} \mathrm{O}(\ell), \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
6. $\mathrm{H}_{2} \mathrm{O}(\mathrm{g}), \mathrm{H}_{2} \mathrm{O}(\ell), \mathrm{H}_{2} \mathrm{O}(\mathrm{s}), \mathrm{C}(\mathrm{s})$ correct

## Explanation:

Gases will have a higher entropy than liquids so we expect $\mathrm{H}_{2} \mathrm{O}(\ell)$ to have the lowest molar entropy. The gases will increase in entropy in the order $\mathrm{Ne}(\mathrm{g})<\mathrm{Ar}(\mathrm{g})<\mathrm{CO}_{2}(\mathrm{~g})$. Ne and Ar are both atoms so they should have less entropy than a molecular substance, which has more complexity. Ar will have a higher entropy than Ne because it has a larger mass and more fundamental particles.

The correct order is
$\mathrm{H}_{2} \mathrm{O}(\ell)<\mathrm{Ne}(\mathrm{g})<\mathrm{Ar}(\mathrm{g})<\mathrm{CO}_{2}(\mathrm{~g})$.

## LDE Entropy 002 <br> $044 \quad 10.0$ points

Which of the reactions below will likely have
the largest increase in entropy $\left(\Delta S_{\mathrm{rxn}}\right)$ ?

$$
\begin{aligned}
& \text { 1. } 2 \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{3}(\mathrm{~g}) \rightarrow \\
& 4 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+2 \mathrm{CO}(\mathrm{~g}) \\
& \text { 2. } \mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NH}_{3}(\mathrm{~g}) \\
& \text { 3. } \mathrm{C}_{5} \mathrm{H}_{12}(\ell)+8 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \\
& \quad 6 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+5 \mathrm{CO}_{2}(\mathrm{~g}) \text { correct }
\end{aligned}
$$

4. $\mathrm{Na}^{+}(\mathrm{g})+\mathrm{Cl}^{-}(\mathrm{g}) \rightarrow \mathrm{NaCl}(\mathrm{s})$
5. $\mathrm{S}_{3}(\mathrm{~g})+9 \mathrm{~F}_{2}(\mathrm{~g}) \rightarrow 3 \mathrm{SF}_{6}(\mathrm{~g})$

## Explanation:

The reaction with the greatest positive value for $\Delta n_{\text {gas }}$ will have the greatest value of $\Delta S_{\mathrm{rxn}}$.

## entropy change for metal heating 1 $045 \quad 10.0$ points

150 grams of iron is heated from $25^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$. What is $\Delta S$ for this change? The specific heat capacity of iron is $0.450 \mathrm{~J} / \mathrm{g} \mathrm{K}$.

1. $-8438 \mathrm{~J} / \mathrm{K}$
2. $0 \mathrm{~J} / \mathrm{K}$
3. $+121 \mathrm{~J} / \mathrm{K}$
4. $-23.6 \mathrm{~J} / \mathrm{K}$
5. $-121 \mathrm{~J} / \mathrm{K}$
6. $+8438 \mathrm{~J} / \mathrm{K}$
7. $+23.6 \mathrm{~J} / \mathrm{K}$ correct

$$
\begin{aligned}
& \text { Explanation: } \\
& \left.\qquad \begin{array}{l}
\Delta S=m C \ln \left(T_{2} / T_{1}\right) \\
\Delta S=150(0.45) \ln \left(\frac{423.15}{298.15}\right) \\
\Delta S=150(0.45) \ln (1.42) \\
\Delta S
\end{array}\right)++23.6 \mathrm{~J} / \mathrm{K}
\end{aligned}
$$

## ChemPrin3e T07 40 <br> $046 \quad 10.0$ points

Calculate $\Delta S_{\text {surr }}^{\circ}$ at 298 K for the reaction

$$
6 \mathrm{C}(\mathrm{~s})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{C}_{6} \mathrm{H}_{6}(\ell)
$$

$\Delta H_{\mathrm{r}}^{\circ}=+49.0 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ and $\Delta S_{\mathrm{r}}^{\circ}=-253$ $\mathrm{J} \cdot \mathrm{K}^{-1} \cdot \mathrm{~mol}^{-1}$.

1. $-417 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$
2. $+253 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$
3. $-164 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$ correct
4. $+164 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$
5. $-253 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$

## Explanation:

$\Delta H_{\mathrm{r}}^{\circ}=49000 \mathrm{~J} \cdot \mathrm{~mol}^{-1} \quad T=298 \mathrm{~K}$

$$
\begin{aligned}
\Delta S_{\text {surr }}^{\circ} & =\frac{q_{\text {surr }}}{T}=\frac{-q}{T}=\frac{-\Delta H_{\mathrm{r}}^{\circ}}{298 \mathrm{~K}} \\
& =\frac{-\left(+49000 \mathrm{~J} \cdot \mathrm{~mol}^{-1}\right)}{298 \mathrm{~K}} \\
& =-164.43 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1} .
\end{aligned}
$$

## LDE Temperature and Phase Changes 003 $047 \quad 10.0$ points

Based on the enthalpy of sublimation $\left(\Delta H_{\text {sub }}=393.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)$ and entropy of sublimation $\left(\Delta S_{\text {sub }}=2.023 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1} \cdot \mathrm{~K}^{-1}\right)$ of carbon dioxide, at what temperature does this phase transition occur?

1. $78.5^{\circ} \mathrm{C}$
2. -78.5 K
3. $0.2^{\circ} \mathrm{C}$
4. $-78.5^{\circ} \mathrm{C}$ correct
5. 0.2 K

## Explanation:

$$
\begin{aligned}
& T_{\text {sub }}=\frac{\Delta H_{s u b}}{\Delta S_{s u b}}=\frac{393.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}}{2.023 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1} \cdot \mathrm{~K}^{-1}}= \\
& 194.5 \mathrm{~K}=-78.5^{\circ} \mathrm{C}
\end{aligned}
$$

$048 \quad 10.0$ points
For the reaction

$$
2 \mathrm{C}(\mathrm{~s})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})
$$

$\Delta H_{\mathrm{r}}^{\circ}=+52.3 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ and $\Delta S_{\mathrm{r}}^{\circ}=$ $-53.07 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$ at 298 K . The reverse reaction will be spontaneous at

1. no temperatures.
2. temperatures below 1015 K .
3. temperatures above 985 K .
4. all temperatures. correct
5. temperatures below 985 K .

## Explanation:

$\Delta G=\Delta H-T \Delta S$ is used to predict spontaneity. ( $\Delta G$ is negative for a spontaneous reaction.) $T$ is always positive; for the reverse reaction, we reverse the sign of $\Delta H$ and $\Delta S$. We thus have $\Delta G=(-)-T(+)$ for the reverse reaction, so $\Delta G$ will be negative for any physically possible value of $T$.

## ChemPrin3e T07 52 <br> $049 \quad 10.0$ points

Calculate $\Delta G_{\mathrm{r}}^{\circ}$ for the decomposition of mercury(II) oxide

$$
2 \mathrm{HgO}(\mathrm{~s}) \rightarrow 2 \mathrm{Hg}(\ell)+\mathrm{O}_{2}(\mathrm{~g})
$$

| $\Delta H_{\mathrm{f}}^{\circ}$ | -90.83 | - | - |
| :--- | :---: | :---: | :---: |
| $\left(\mathrm{kJ} \cdot \mathrm{mol}^{-1}\right)$ |  |  |  |
| $\Delta S_{\mathrm{m}}^{\circ}$ | 70.29 | 76.02 | 205.14 | $\left(\mathrm{J} \cdot \mathrm{K}^{-1} \cdot \mathrm{~mol}^{-1}\right)$

at 298 K .

1. $-117.1 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
2. $-246.2 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
3. $+117.1 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ correct
4. $+246.2 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$
5. $-64.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$

## Explanation:

In order to find $\Delta G_{\mathrm{r}}^{\circ}$ at 298 K , we must first calculate $\Delta H_{\mathrm{r}}^{\circ}$ and $\Delta S_{\mathrm{r}}^{\circ}$.

$$
\begin{aligned}
\Delta S_{\mathrm{r}}^{\circ}= & 2 \cdot S_{\mathrm{Hg}(\ell)}^{\circ}+S_{\mathrm{O}_{2}(\mathrm{~g})}^{\circ}-2 \cdot S_{\mathrm{HgO}(\mathrm{~s})}^{\circ} \\
= & 2\left(76.02 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}\right)+205.14 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}} \\
& -2\left(70.20 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}\right) \\
= & 216.6 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}
\end{aligned}
$$

$$
\begin{aligned}
\Delta H_{\mathrm{r}}^{\circ} & =2 \cdot H_{\mathrm{Hg}(\ell)}^{\circ}+H_{\mathrm{O}_{2}(\mathrm{~g})}^{\circ}-2 \cdot H_{\mathrm{HgO}(\mathrm{~s})}^{\circ} \\
& =0-2(-90.83 \mathrm{~kJ} / \mathrm{mol}) \\
& =181.64 \mathrm{~kJ} / \mathrm{mol}
\end{aligned}
$$

$$
\begin{aligned}
\Delta G_{\mathrm{r}}^{\circ}= & \Delta H_{\mathrm{r}}^{\circ}-T \Delta S_{\mathrm{r}}^{\circ} \\
= & 181.64 \mathrm{~kJ} / \mathrm{mol}-(298 \mathrm{~K}) \\
& \times\left(216.6 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}\right)\left(\frac{1 \mathrm{~kJ}}{1000 \mathrm{~J}}\right) \\
= & 117.093 \mathrm{~kJ} / \mathrm{mol}
\end{aligned}
$$

## LDE Gibbs Stability Ranking 002 $050 \quad 10.0$ points

Use the table data

|  | $\Delta G_{\mathrm{rxn}}^{\circ}$ <br> $[\mathrm{kg} /(\mathrm{mol} \cdot \mathrm{K})]$ |
| :--- | :--- |
| $\mathrm{AgCl}(\mathrm{s}) \rightarrow \mathrm{Ag}(\mathrm{s})+\frac{1}{2} \mathrm{Cl}_{2}(\mathrm{~g})$ | 109.7 |
