Explain why equilibium constants are dimensionless.

1. Every concentration or pressure that enters into $K_{\mathrm{c}}$ or $K_{\mathrm{p}}$ is really divided by the cor-
responding concentration or pressure of the substance in its standard state.
2. They are dimensionless because the pressures or concentrations we put in are all for the substances in their standard states.
3. They are dimensionless because concentrations and pressures have no units.
4. The statement is not true. Equilibrium constants have units that involve some multiple of atmospheres or moles per liter.
5. They are not really dimensionless but we must treat them as such in order to be able to take $\ln K$ in the expression $\Delta G^{0}=$ $-R T \ln K$.
